@demotoprod · CHECKLIST

Disputed-answer checklist

An airline's website chatbot invented a ninety-day refund window. The policy page said the opposite. In February 2024 a tribunal awarded the customer C$812.02, called the "separate legal entity" defence remarkable, and found no reason a customer should know which part of a website to trust. The side that lost was the side with no evidence. Five checks.

1 Log every answer as evidence

The company could not show what its bot had been told or why its page should outrank the bot. A dispute is won by whoever can replay the conversation.

- Store, per answer: an id, the timestamp, the exact text shown, the sources used (with their version), the prompt version, the model id and the retrieval set.
- Keep it for the whole dispute window of your market, hashed as it is written, where the bot cannot change it.
- Replay from the log, never from memory, when a customer disputes an answer.

```
{"answer":"a81f","ts":"2026-10-16T09:12Z","shown":"...","sources":
["policy/bereavement#v12"],
 "prompt_v":"14","model":"pinned-2026-09","retrieved":["doc-2231","doc-0917"]}
```

2 Cite or decline

The ninety-day window came from nowhere. A figure, a date or a rule that the bot cannot point to is a promise nobody authorised.

- Every answer that carries a number, a date or a policy rule quotes the page it came from, with a link.
- No source found means the bot says so and hands over; it never fills the gap from training data.
- Count answers with an empty sources list every day; the target is zero.

```
grep -c '"sources": \[\]' answers.jsonl    # answers with no citation: want 0
```

3 One source of truth, stated in writing

The tribunal found no reason a customer should know that one section of the website is accurate and another is not. Precedence has to be yours, written down, before a dispute tests it.

- The policy page is canonical; the bot's answer is derived from it and says so in its footer.
- When they disagree, the page wins and the bot is corrected inside a set time; log every correction.
- Put the precedence statement in the terms the customer accepts, and in the bot's own first message.

4 A named owner and a deadline

Disputed answers that sit in a queue become claims. A person, a replay and a reply inside a fixed number of days turn them back into tickets.

- Route every disputed answer to a named owner with the replay attached; the deadline is in days, not 'soon'.
- Track the count and the time to reply as a release metric, alongside accuracy.

5 Rehearse the dispute

A process that has never been run is a process that does not exist. The airline found out in front of a tribunal.

- Take one real wrong answer from last month, run the replay, the source check and the reply, and time it end to end.
- If any step needs a person to search a chat channel for a screenshot, fix the log first.
